

Specs would be:

- Automatic mail send depending on the status of a claim in the db. The event is fired by our admin staff when handling the claims.
- Password forgotten with nodemailer, I already have everything AUTH installed with Passport.
- Email validation once user is registered.

I have already put some designs in the front end, others will be given to you.

Ideal timeline would be:

1. We deliver the milestones.
2. You sign the NDA.
3. I give you access to read my code and explain on Skype everything as I would like you to follow my code structure.
4. You start doing each milestone and I will review them after completion.

If successful I need many projects to be done on my website such as electronic signatures for clients to sign easier Power of Authorization instead of printing signing and scanning, or a platform for agencies to work with me.
